

Analysis of Persons Served

07/01/13 to 06/30/14

Discharge Analysis by Diagnosis, Length of Stay and Discharge Disposition: The majority of our patients fall into 6 categories – Stroke, Orthopedics, Brain Injury, Spinal Cord Injury, Neurological Disorder and Amputation. The vast majority of our patients return home after their inpatient rehabilitation stay.

The Functional Independence Measure (FIM) is used to measure a patient's function in 18 skill levels in the areas of self care, sphincter control, transfers, locomotion, communication, and social/ cognition. The FIM compares the functional change achieved by our patients with patients receiving care in other regional facilities. The efficiency score is the average amount of functional change a patient will experience from admission to discharge. The higher the efficiency number, the more functional gains achieved.

Actual average treatment time per patient per day is: 3.4 hours

Diagnosis	Average Age	Number of Discharges	Percent of Total Discharges	Average Length of Stay	FIM Efficiency GSH	FIM Efficiency Region
Stroke	69	132	27	13	2.93	2.15
Brain Injury	66	46	9	10	3.07	2.45
Neurological	67	74	15	11	2.86	2.49
Spinal Cord	67	44	9	11	3.06	2.26
Amputation	60	19	4	11	1.63	2.00
Arthritis	66	6	1	8	4.03	2.89
Orthopedics	74	75	15	10	3.11	2.98
Multiple Trauma	64	5	1	12	3.71	2.77
Debility	75	27	5	8	3.31	2.39
Pain Syndrome	51	2	0	8	4.79	3.28
